Further Explorations

- Use a notifier to inform the user if they entered incorrect password and ask them to try again.
- Allow the users to enter their own choice for a password to access their To Do List rather than handing them a hardcoded password you provide.
- Allow editing of an existing To Do List item.
- Allow the users to indicate due dates/deadlines for the list items as they enter into the list.
- Create something like a star rating system where the user can indicate relative urgency and importance of the tasks in their To Do List.
- Allow the user to enter To Do List items by speaking to the mobile device, for example in case the user is unable to type.
- Give an option for the mobile device to do, for example in case the user is visually impaired.
